### PHP Conference session slides

Stephan uploaded the slides for his two talks on the International PHP Conference in Amsterdam yesterday evening. Apparently both sessions were well attended, and the Power Workshop on XML and WebServices he has made along with Tobias Schlitt went quite well

You can have a look at the slides for Stephan's talks right here:

Go OO! - Real-life Design Patterns in PHP5  
Component and Event Based Architectures

The examples are not included yet, but we will add them as a separate package soon.

In your component and event based architectures presentation you said about PRADO that "These frameworks often support only one-to-one binding of an event to a method." Just would like to mention that this not true in PRADO, some events can bubble, and can continue bubbling even if the event was caught (or the developer can stop the bubbling). Of course, you can also create your own bubble event as well.

```
TControl::raiseBubbleEvent(TComponent $sender, TEventParameter $param)
and
TControl::onBubbleEvent($sender, $param)
