patError 1.0 beta released

Dealing with errors and failures is a mess. Errors may appear in every part of an application. Some of them can be ignored others do harm. Furthermore the complexity of errors usually grows with the complexity of the application. Using patError allows you to handle all kind of errors in an unitary and easy way. Even if patError is very easy to use, it is very flexible in design and allows all kinds of error-handling.

patError Overview
